

Some Sample Reports on Turbines and Tourism

Some locations are heavily dependent on tourism dollars and employment. Let's use North Carolina's *Crystal Coast* (Carteret County) as an example.

Most states list tourism related economics. In this case, the [North Carolina Department of Commerce](#) indicates the 2020 figures for Carteret County are:

\$400± million in Tourism related revenue

3650± jobs in Tourism related businesses

\$40± million in state and local tax revenues from travel to Carteret County. (This represents a \$565± tax saving to each county resident.)

Almost all studies done by independent experts conclude that there will be Tourism business lost when industrial wind energy is introduced into a tourist area. Some play it down by saying that these losses are not "significant."

The most detailed study to date, funded by the [Scottish Government](#) (a wind proponent) concluded that the annual losses would be from 2% to 6%. A decrease of 4% in the *Crystal Coast* tourism business would amount to:

\$16± million in Tourism related revenue lost annually, plus

146± Tourism jobs lost annually

It seems that most people would consider those losses to be significant. And this is just one economic burden to the community (see [WiseEnergy.org](#)) — but this just by itself, would result in any locally proposed wind project being a NET LOSS. In other areas, the significance of the impact will vary.

[Here](#) is a collection of **200±** articles & reports on the effects on Tourism from industrial wind energy being nearby. Below is a sample of these studies:
